

Black Paper «ZENITH» Protocol

«ZENITH» Protocol is an open, public resource.
This is a bridge between cryptocurrencies and the global financial system.
«ZENITH» Protocol makes it possible to sign any transactions networks Ethereum,
carried out with the help of ERC tokens.
This makes it possible to identify and verify payments.

Cryptocurrencies are seeking to integrate into the global financial system.

What prevents them from doing this:

1. Anonymity.
All over the world there is a war against crime, money laundering.
And such dignity, as anonymity, scares the global financial system and is an obstacle to integration into everyday life.
2. Developers of crypto ecosystems tend to independently and separately implement their cryptocurrency in the financial structure.
There are attempts to integrate cryptocurrencies into different payment systems, but each such development is aimed at integrating only its own coin.
Each such development has its own separate decentralized structure.

Purpose of creating «ZENITH» Protocol:

«ZENITH» Protocol is designed to implement a unified strategy to unite cryptocurrency developers.
This will allow this ecosystem to more easily integrate into legal, real financial life.
